

Website Content Verification Report

CODDEN - Independent Technology & Digital Creative Atelier

Single-page website audit - index.html + case-study drawer data (js/codden.js)

Date: 2026-09-30 | Purpose: client verification of visible content (NOT a design review)

Method: full scan of nav, hero, work, services, manifesto, solutions, process, technology, industries, about, insights, contact wizard, finale, drawer, visuals, forms.

1. Report Overview

This report documents the ACTUAL visible copy currently present on the CODDEN website so the client can confirm correctness, relevance, and factual accuracy. Wording is preserved exactly where possible (minor symbol transliteration for PDF: -> for arrows, - for dashes/bullets). Nothing has been rewritten or improved.

Scope: one single-page site with anchored sections 00-10 plus a full-screen case-study drawer (5 cases), a 6-step intake wizard, directory sidebar, and footer. No Testimonials section and no FAQ section were found. No pricing page was found (only budget ranges inside the intake wizard). No phone, address, or opening hours were found.

How to use: for each content item check one box: Correct / Needs Correction / Missing-Should Be Added / Needs Verification. Items flagged Needs Verification are collected in Section 10.

2. Complete Website Content - Navigation & Global Elements

Browser / Meta

- Page <title>: CODDEN - Independent Technology & Digital Creative Atelier
- Meta description: "Codden is an independent technology and design studio. We design, engineer and scale high-concurrency digital platforms, software, and creative media for ambitious businesses."

Opening curtain (loader)

- Visible text: C O D D E N (animated brand characters, no other copy).

Global header nav

- Brand mark: CODDEN (with green status dot, non-text). Links: Work | Services | Solutions | Process | Technology | About | Insights. CTA button: Start a Project -> (links to #contact).

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Directory sidebar (CODDEN // DIRECTORY)

- Header: CODDEN // DIRECTORY | badge: ATELIER | button: CLOSE X
- Label: UNIFIED SECTIONS // SINGLE PAGE. Items: 00 Hero & Motion Deck | 01 Selected Work & Cases | 02 Capabilities & Stacks | 03 Problem Solutions Finder | 04 7-Phase Process & Maturity | 05 Architecture Topology Map | 06 Industry Domains | 07 About Studio & Beliefs | 08 Technical Perspectives | 09 6-Step Project Intake.
- Direct Channel: hello@codden.tech | Note: Direct architect review within 24h

- Studio Positioning: Technology + Product Development + Creative Systems under one unified engineering team.
- CTA: Start a Project -> | Footer: live UTC timecode (dynamic) | CODDEN ATELIER - ZERO-SURFACE TOLERANCE

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

3. Page-by-Page Content (single-page sections)

Section 00 - Hero (#hero)

- Heading (exact): WE BUILD / DIGITAL
- Lead (exact): From futuristic platforms that scale to millions to enchanting digital habitats, we are driven by a passion for technical rigor and architectural distinction.
- Motion-frames bar buttons: FR 01 3D Organic | FR 02 Parametric | FR 03 Spatial | FR 04 Mechanics
- Deck card HUD text: FR // 01, FR // 02, FR // 03, FR // 04; each with MOTION pill; labels TACTILE 3D / PARAMETRIC / BRUTAL SPACE / MECHANICAL; each with 4K - 60FPS.
- Lower third tagline (exact): We create smart solutions / for your projects (with + symbol). CTA button: Explore Work (-> arrow, links #work).

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 01 - Selected Work (#work)

- Eyebrow: ENGINEERED PRODUCTION CASES // 01
- Heading: Selected / Cases.
- Statement (exact): Real products engineered for scale, durability, and brand distinction. Click any case below to inspect its technical architecture and verified outcomes.
- Grid shows 4 cases (drawer holds 5; Veloce 3D only in drawer - see Sec. 4). Each card shows CASE 00 // FLAGSHIP, CASE 01 // PRODUCTION, CASE 02 // INTELLIGENCE, CASE 03 // ANALYTICS; FPS: 60; link text: Inspect Architecture & Outcomes ->
- Case 00: Aura OS | meta: Spatial Canvas - 2026 | desc: Next-generation spatial design canvas engineered in WebGL 2.0 and Rust/WASM, reducing CPU usage by 74% and sustaining locked 60fps at 25,000 active nodes.
- Case 01: Rideflow | meta: Mobility Platform - 2026 | desc: High-concurrency urban dispatch system coordinating 120,000+ real-time passenger journeys, driver state machines, and micro-billing transactions in Go.
- Case 02: NeuroLens AI | meta: Enterprise Intelligence - 2026 | desc: Autonomous multi-modal intelligence pipeline parsing high-volume regulatory filings with private Qdrant vector retrieval and automated telemetry.
- Case 03: Apex Metrics | meta: Financial Infrastructure - 2025 | desc: Columnar time-series analytics engine in ClickHouse processing 100M+ daily market ticks, risk thresholds, and liquidity metrics with sub-50ms responses.

Verification Status (each case verified separately in Sec. 4): [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 02 - Capabilities (#services)

- Eyebrow: FULL-SPECTRUM CAPABILITIES // 02 | Heading: Every Digital / Layer.

- Statement (exact): We don't separate engineering from design. We build complete, high-concurrency systems from foundational strategy to final pixel.
- 01 Digital Products: Web Platforms, SaaS Applications, Customer Portals, Headless E-Commerce
- 02 Software Systems: Custom Enterprise ERP, Distributed APIs, Business Automation, Cloud Infrastructure
- 03 Mobile Engineering: iOS Native (Swift), Android (Kotlin), Flutter 60fps, React Native
- 04 Intelligence & AI: Autonomous Agents, Enterprise RAG, Vector Search, Computer Vision
- 05 Design Systems: Product UI/UX, Visual Brand Identity, Component Tokens, Interactive Prototyping
- 06 3D & Creative Media: WebGL & Three.js, 3D Product CGI, Motion Identity, Visual Campaigns
- 07 Cloud & Infrastructure: Kubernetes / Docker, Multi-Region Cloud, SOC2 Hardening, CI/CD Automation

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Manifesto strip (#manifesto)

- Statement (exact): "Code is only one part of what we do." Flow: Strategy -> Design -> Engineering -> Graphics -> Experience (Experience highlighted).

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 03 - Solutions finder (#solutions)

- Eyebrow: DIAGNOSTIC ENGINE // 04 | Heading: Start with the problem. We'll figure out the technology.
- Desc (exact): Click the scenario that best represents your commercial friction to see Codden's proven architectural recommendation and execution roadmap.
- Tabs: "We need to automate a manual process" | "We need to launch a new product" | "Our existing product is outdated" | "We need an online presence that builds trust"
- Result A - RECOMMENDED ARCHITECTURE // AUTOMATION - Automated Operations Backbone: Replace manual spreadsheet entry, repetitive routing, and fragile handoffs with an asynchronous event-driven workflow engine. Tags: Workflow Automation, Internal Tools, API Integrations, Deterministic AI. Roadmap: Phase 1 (Week 1-2): Process audit & bottleneck mapping; Phase 2 (Week 3-5): Integration pipelines & database modeling; Phase 3 (Week 6-8): Staff dashboard & automated failover testing. CTA: Discuss This Automation Blueprint ->
- Result B - RECOMMENDED ARCHITECTURE // 0 TO 1 - Full-Lifecycle Production MVP: Rapid 10-to-12-week build taking an unbuilt concept through technical discovery, UX design, hardened backend engineering, and multi-tenant release. Tags: Product Strategy, UI/UX Systems, Full-Stack Engineering, Cloud Infrastructure. Roadmap: Phase 1 (Week 1-3): User flows, wireframes & tech specs; Phase 2 (Week 4-8): Core engineering, auth, API & database; Phase 3 (Week 9-11): QA, security review & production rollout. CTA: Plan Your Product Launch ->
- Result C - RECOMMENDED ARCHITECTURE // MODERNIZATION - Zero-Downtime Strangler Rebuild: Gradually replace fragile legacy code with modern micro-services while the live business continues operating without disruption. Tags: Code Audit, Database Migration, Modern Frontend, Performance Tuning. Roadmap: Phase 1 (Week 1-2): Legacy code audit & strangler boundary; Phase 2 (Week 3-7): Core service rewrite & dual-write syncing; Phase 3 (Week 8-10): Live cutover, load testing & decommission. CTA: Discuss Strangler Migration ->

- Result D - RECOMMENDED ARCHITECTURE // DIGITAL ATELIER - High-Authority Flagship Experience: Elevate your commercial perception with a bespoke WebGL, ultra-motion web presence that builds investor trust and consumer desire. Tags: Brand Identity, Interactive WebGL, Motion Engineering, Sub-100ms LCP. Roadmap: Phase 1 (Week 1-2): Brand positioning & 3D asset modeling; Phase 2 (Week 3-5): Creative motion prototyping & shader dev; Phase 3 (Week 6-8): Full-device QA, edge CDN routing & launch. CTA: Build Your Digital Flagship ->

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Section 04 - Process (#process)

- Eyebrow: ENGINEERING DISCIPLINE // 05 | Heading: Good products are built / through a process.
- Desc (exact): Software projects do not fail from lack of code; they fail from ambiguous scope and absent architectural planning. Our 7-phase discipline guarantees predictable execution from raw idea to scale.
- PHASE // 01 Discovery: We interrogate the product requirement: What are we building? Who is it for? What critical business problem does it solve? What are the non-negotiable performance constraints? Deliverables: Documented Requirements Spec, User Personas & Edge Cases, Initial Architecture Blueprint, Technical Feasibility Audit.
- PHASE // 02 Planning & Architecture: Mapping milestones, selecting production technologies, defining data models, and establishing sprint cadences with zero speculative scope. Deliverables: Entity-Relationship Schemas, Sprint Milestone Schedule, API Contract Definitions, DevOps Infrastructure Plan.
- PHASE // 03 Design & Prototyping: Translating complex user workflows into intuitive visual hierarchies. We build high-fidelity interactive prototypes to validate interactions before expensive code implementation. Deliverables: Figma Design Token System, Interactive Prototype, Desktop & Mobile Layouts, Micro-Interaction Specs.
- PHASE // 04 Engineering & Implementation: Writing modular, type-safe, testable production code. Backends built for concurrency; frontends engineered for instant render cycles and zero layout shifts. Deliverables: Production-Grade Codebase, Automated CI/CD Pipeline, Comprehensive Unit Tests, Staging Deployment URLs.
- PHASE // 05 Testing & Hardening: Exhaustive end-to-end integration tests, load profiling, vulnerability scanning, cross-browser validation, and data security compliance checks. Deliverables: Load & Concurrency Benchmarks, Penetration & Security Audit, Cross-Device QA Reports, Regression Test Pass.
- PHASE // 06 Deployment & Launch: Zero-downtime blue/green cutover to multi-region cloud infrastructure, DNS propagation, SSL/TLS validation, and real-time observability telemetry. Deliverables: Multi-Region Cloud Deployment, Real-Time Sentry / APM Logging, Full Architecture Documentation, Automated Database Backups.
- PHASE // 07 Growth & Evolution: Software is a living asset. We analyze production telemetry, optimize bottlenecks, roll out incremental feature enhancements, and scale server infrastructure. Deliverables: Monthly Reliability Reviews, Feature Iteration Sprints, Cloud Cost Optimization, Dedicated Architect Retainer.
- Sub-block: ENGAGEMENT ARCHITECTURE | Heading: Project maturity levels. | Desc: Not every business arrives at the same stage. We structure our collaboration around your actual project maturity rather than arbitrary sales tiers.
- LEVEL // 01 IDEA - Early-stage concepts, unvalidated ideas, new digital products. Includes: Problem Discovery, Feasibility Analysis, Architecture Spec, Low-Fidelity UX.

- LEVEL // 02 PROTOTYPE - Securing seed investment, partner demos, core user flow validation. Includes: High-Fidelity UI, Clickable Prototype, Core User Journeys, Technical Roadmap.
- LEVEL // 03 MVP - First commercial release, initial paying customers, market validation. Includes: Full-Stack Build, Authentication & Billing, Core Feature Loop, Cloud Deployment.
- LEVEL // 04 PRODUCTION - Hardened commercial platforms, multi-tenant SaaS, mission-critical tools. Includes: High-Availability Cloud, RBAC & SOC2 Hardening, Automated CI/CD, SLA Guarantees.
- LEVEL // 05 SCALE - Scaling to millions of users, distributed microservices, global expansion. Includes: Microservices Split, Multi-Region Database, Custom AI Models, Dedicated Pod Retainer.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 05 - Technology (#technology)

- Eyebrow: TOPOLOGY VISUALIZATION // 06 | Heading: Interactive architecture map.
- Desc (exact): Hover or tap any cluster node below to inspect its role inside Codden's production architecture.
- Map nodes (visible labels): CODDEN (center) | FRONTEND | BACKEND | MOBILE | AI & ML | DATA | CLOUD.
- Default overlay: CODDEN CORE ARCHITECTURE / Central coordination layer uniting Product Strategy, Design Systems, High-Concurrency Engineering, and Cloud Infrastructure under one single responsible team. / HOVER ANY NODE TO INSPECT
- FRONTEND hover: Next.js, React, WebGL, Vanilla CSS, WebAssembly. Sub-second initial paints, 60fps render cycles, accessible DOM hierarchies, and zero layout shift. [VERIFIED // SUB-100MS FCP]
- BACKEND hover: Go, Node.js, Python, PostgreSQL, Redis, gRPC microservices. Asynchronous event loops, database connection pooling, and deterministic data modeling. [VERIFIED // 100K+ RPS THROUGHPUT]
- MOBILE hover: Swift (iOS), Kotlin (Android), Flutter, React Native. Native offline storage, background GPS telemetry, biometric auth, and butter-smooth gestures. [VERIFIED // 60FPS RUNTIME]
- AI hover: Autonomous multi-step agents, private VPC retrieval-augmented generation (RAG), vector embeddings with Qdrant/Pinecone, and automated safety fences. [VERIFIED // ZERO HALLUCINATION TRAPS]
- DATA hover: ClickHouse, Kafka, PostgreSQL, Redis, Elasticsearch. Time-series market ingestion, multi-tenant partitioning, and sub-50ms aggregation queries. [VERIFIED // 100M+ DAILY EVENTS]
- CLOUD hover: Docker, Kubernetes, AWS, Cloudflare Edge, Terraform. Automated blue/green rollouts, DDOS mitigation, and SOC2 compliant telemetry. [VERIFIED // 99.99% PRODUCTION SLA]

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 06 - Industries (#industries)

- Eyebrow: DOMAINS & VERTICALS // 07 | Heading: Engineering for specific realities.
- Desc (exact): Software requirements vary drastically by industry. We design systems shaped by the strict regulatory, throughput, and operational realities of specific sectors.

- DOMAIN // 01 HIGH CONCURRENCY - Mobility & Logistics: Real-time geospatial dispatch, dynamic pricing algorithms, low-latency driver sockets, and automated reconciliation across fleet networks. Spec: Throughput SLA: Sub-50ms Dispatch; Core Technologies: Go, Redis, PostGIS, MQTT.
- DOMAIN // 02 COMPLIANCE & RISK - FinTech & Markets: High-throughput order books, immutable double-entry ledger bookkeeping, KYC/AML regulatory workflows, and bank-grade encryption at rest and in transit. Spec: Compliance: SOC2 Type II, PCI-DSS; Core Technologies: Rust, ClickHouse, Kafka, AWS.
- DOMAIN // 03 DATA PRIVACY - HealthTech & Clinical: End-to-end encrypted telemetry, patient intake portals, doctor-patient video WebRTC tunnels, and HIPAA/GDPR certified cloud data compartmentalization. Spec: Standards: HIPAA, FHIR, GDPR; Core Technologies: Python, PostgreSQL, WebRTC.
- DOMAIN // 04 MULTI-TENANT - Enterprise SaaS: Role-based access control (RBAC), multi-tenant schema isolation, SAML/SSO enterprise authentication, and customized white-label tenant styling. Spec: Tenant Isolation: Row-Level Security; Core Technologies: Next.js, Node.js, Prisma.
- DOMAIN // 05 SUB-100MS LCP - Headless Retail: Blazing edge storefronts, instant localized checkout with Stripe Elements, real-time inventory locking, and interactive 3D product previews. Spec: Performance: 99+ Google Lighthouse; Core Technologies: Shopify Plus, Three.js, Vercel.
- DOMAIN // 06 RAPID 10-WEEK - Early-Stage Startups: Accelerated 0-to-1 MVP builds engineered with production-grade architecture that won't require a total rewrite after your first million users. Spec: Cycle Time: 10-12 Weeks to Market; Core Focus: Core Loop & Direct Founder Access.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Section 07 - About (#about)

- Eyebrow: STUDIO PHILOSOPHY // 08 | Heading: About Studio.
- Desc (exact): Codden was founded on a simple realization: the digital agency landscape is painfully divided between creative design studios that cannot write production code, and IT outsourcers that lack all design taste and product judgment. We built Codden to merge both under one roof.
- Card - The Codden Standard (exact): We are not a bloated 500-person agency with junior developers learning on your budget. We operate as an elite, high-touch engineering atelier where every member of our team is a senior contributor with proven production credentials. / When you build with Codden, you speak directly with the engineers authoring your architecture and the designers crafting your interface.
- Card - Full Intellectual Property (exact): We believe you should own your technology. 100% of repository code, Figma components, database schemas, and deployment credentials transfer directly to your company upon milestone completion. / No proprietary vendor lock-in. No hostage codebases. Total transparency.
- BELIEF // 01 Technology Should Solve Problems: We write software to generate commercial leverage and reduce friction, not to construct artificial complexity.
- BELIEF // 02 Design Makes Complexity Clear: The best user interface is not the one with the most elements; it is the one that makes intricate systems feel effortless.
- BELIEF // 03 Invisible Quality Matters: Database indexing, memory garbage collection, and type-safety matter just as much as typography and color palettes.
- BELIEF // 04 Direct Collaboration Wins: Eliminating layers of non-technical account managers saves weeks of miscommunication and ensures precision.

- BELIEF // 05 Honest Engineering Trade-offs: Every architectural decision involves trade-offs. We transparently explain them before writing a single line of code.
- COMMITMENT // 06 Long-Term Maintainability: We write modular, well-documented code designed for your future internal team to inherit and scale seamlessly.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Section 08 - Insights (#insights)

- Eyebrow: TECHNICAL PERSPECTIVES // 09 | Heading: Insights & Essays.
- Desc (exact): We do not write superficial marketing listicles. We document architectural decisions, distributed system trade-offs, and lessons learned from production deployments.
- Essay 1: ENGINEERING ARCHITECTURE - 7 MIN READ - The Myth of the 4-Week Production MVP in 2026: Why rushing a prototype directly into customer hands without data schemas, auth hardening, and rollback mechanisms guarantees technical bankruptcy within 6 months.
- Essay 2: DISTRIBUTED SYSTEMS - 9 MIN READ - Concurrency Before UI: Designing Real-Time Event Loops: A deep-dive into WebSocket connection scaling, state synchronization, and race condition prevention when orchestrating tens of thousands of concurrent client actions.
- Essay 3: APPLIED INTELLIGENCE - 6 MIN READ - Pragmatic AI: Implementing RAG Without Hallucination Traps: How enterprise teams can safely leverage vector embeddings and private LLM inference while maintaining deterministic source grounding and strict zero-data-retention guarantees.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Section 09 - Contact wizard (#contact)

- Eyebrow: START A BUILD // 10 | Heading: Tell us what you're building.
- Desc (exact): Complete our 6-step project wizard so our senior architects can review your technical scope and prepare a tailored engineering roadmap within 24 hours.
- Steps: 1 Scope | 2 Stage | 3 Details | 4 Investment | 5 Timeline | 6 Contact.
- Step 1 Q: What type of deliverable do you need? / Select the primary discipline required for your project. Options: Web Application (SaaS, portals, high-concurrency browser platforms) | Mobile App (iOS, Android, Flutter, cross-platform native) | Software Systems (Internal ERP, CRM, microservices, gRPC backends) | AI & Automation (Private LLMs, workflow agents, vector search) | UI/UX Design (User research, design systems, interactive Figma) | Creative & 3D (Brand identity, motion graphics, Three.js WebGL). Nav: Next: Project Stage ->
- Step 2 Q: What stage is your product in? / This helps us match the appropriate maturity level and team composition. Options: Early Idea / Concept (Raw idea requiring feasibility, discovery, and UX architecture) | Prototype Validation (Need a clickable high-fidelity build for investor/partner demos) | New Product (0 to 1) (Ready to build and launch an initial commercial production release) | Modernize Existing Platform (Replace legacy software or redesign an active product). Nav: Back / Next: Project Details ->
- Step 3 Q: Tell us about your project objectives. / What problem are you solving? Who is it for? Field placeholder: Briefly describe what you are building, your primary goals, and any mandatory technical requirements... Nav: Back / Next: Investment Scope ->

- Step 4 Q: What is your planned investment budget? / We structure architecture to maximize ROI within your capital allocation. Options: \$15,000-\$25,000 (Focused prototypes, discovery specs, design sprints) | \$25,000-\$50,000 (Full commercial MVP build, custom web/mobile app) | \$50,000-\$100,000 (Enterprise SaaS, high-concurrency systems, AI platform) | \$100,000+ (Multi-platform ecosystem, end-to-end digital transformation). Nav: Back / Next: Target Timeline ->
- Step 5 Q: What is your target launch timeline? / Helps us allocate engineering pod capacity and sprint cadences. Options: 4-8 Weeks (Rapid turnaround prototype or focused feature addition) | 8-12 Weeks (Standard production-grade MVP lifecycle) | 3-6 Months (Large multi-tenant system or enterprise platform) | Ongoing Retainer (Dedicated long-term engineering and architecture pod). Nav: Back / Next: Final Contact Info ->
- Step 6 Q: Where should we dispatch our architectural review? / A senior engineering director will review your submission directly within 24 business hours. Fields: Your Full Name * | Work Email Address * | Company / Startup Name. Submit button: Submit Architecture Request -> (validation message if empty: Please provide your name and work email so our engineering directors can reach you.)
- Receipt (post-submit): INTAKE VERIFIED / Intake Dispatch Confirmed / #CDN-000000 (random). Shows Scope, Stage, Investment, Timeline, Recipient. Note: [ok] Your architectural specifications have entered our direct director review queue. We will respond within 24 business hours with an initial evaluation. Link: Return to Top.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Section 10 - Finale footer (#finale)

- Monumental text (exact): LET'S BUILD / SOMETHING.
- Label: DIRECT INQUIRY CHANNEL | Email link: hello@codden.tech
- Social links (visible labels, generic hrefs - Needs Verification): GitHub -> (<https://github.com>) | LinkedIn -> (<https://linkedin.com>) | X / Twitter -> (<https://x.com>) | Dribbble -> (<https://dribbble.com>)
- Bottom meta: (c) 2026 CODDEN ATELIER. ALL RIGHTS RESERVED. | ENGINEERED WITH ZERO-SURFACE TOLERANCE

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

4. Services / Products Verification (one block per offering)

Service 1 - Digital Products

Current heading: Digital Products. Current tags: Web Platforms, SaaS Applications, Customer Portals, Headless E-Commerce. No separate description on card; section statement applies.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 2 - Software Systems

Current heading: Software Systems. Current tags: Custom Enterprise ERP, Distributed APIs, Business Automation, Cloud Infrastructure.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 3 - Mobile Engineering

Current heading: Mobile Engineering. Current tags: iOS Native (Swift), Android (Kotlin), Flutter 60fps, React Native.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 4 - Intelligence & AI

Current heading: Intelligence & AI. Current tags: Autonomous Agents, Enterprise RAG, Vector Search, Computer Vision.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 5 - Design Systems

Current heading: Design Systems. Current tags: Product UI/UX, Visual Brand Identity, Component Tokens, Interactive Prototyping.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 6 - 3D & Creative Media

Current heading: 3D & Creative Media. Current tags: WebGL & Three.js, 3D Product CGI, Motion Identity, Visual Campaigns.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Service 7 - Cloud & Infrastructure

Current heading: Cloud & Infrastructure. Current tags: Kubernetes / Docker, Multi-Region Cloud, SOC2 Hardening, CI/CD Automation.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

Case A - Aura OS Spatial Interface (drawer: CASE 00 // FLAGSHIP ARCHITECTURE)

Subtitle: Next-generation spatial design canvas engineered in WebGL 2.0 and Rust/WASM, reducing CPU usage by 74% and sustaining locked 60fps at 25,000 active nodes. Client: Aura Spatial Systems (San Francisco, CA). Role: Principal Spatial Systems Architect & Lead WebGL Engineer. Timeline: Q1-Q3 2026 - 8 Months Production. Status: VERIFIED PRODUCTION - 420K ACTIVE CREATORS. Live URL shown: <https://superlist.com> [Needs Verification - looks like placeholder].

Metrics: 60 FPS Locked Framerate (Zero stutter with 25,000 active nodes simultaneously) | -74% CPU Overhead (Eliminated DOM & SVG main-thread layout thrashing) | < 8ms Motion-to-Photon (Sub-frame input latency verified on 120Hz ProMotion) | 4.8x Memory Efficiency (Linear typed buffer replacing V8 heap allocations).

Challenge: Enterprise product teams were constrained by traditional DOM-based canvas solutions. When complex documents scaled past 5,000 vectors, browser garbage collector pauses degraded rendering below 18fps, creating severe latency spikes and causing memory exhaustion on team collaborative canvases during critical client reviews.

Solution: We architected an asynchronous rendering engine entirely in Rust compiled to WebAssembly with SIMD parallelization. The entire scene graph, spatial hierarchy, and bounding boxes are maintained in contiguous linear WASM memory. The browser main thread merely receives low-overhead input events, while WebGL 2.0 handles instanced draw calls at 60fps locked.

Innovations: Contiguous WASM Scene Graph (Flat binary array buffers manage transforms and hierarchy with zero garbage collection cycles, bypassing JavaScript V8 heap overhead entirely.) | Dynamic Draw-Call Batching (Custom GLSL shaders batch 25,000 discrete objects into fewer than 16 GPU draw calls per frame using hardware instancing.) | Offscreen Worker Dispatch (Hit-testing and spatial quadtree partitioning are evaluated off the main UI thread via shared ArrayBuffer transfer.)

Outcome: Adopted across 420,000+ daily active designers across tier-1 technology teams. Achieved 99.99% session stability, reduced average client machine battery drain by 62%, and secured universal praise for zero-latency collaboration. Stack: Rust - WebAssembly (WASM) - WebGL 2.0 - GLSL Shaders - Web Workers - TypeScript - OffscreenCanvas.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Case B - Rideflow Urban Dispatch Platform (drawer: CASE 01 // PRODUCTION MOBILITY)

Subtitle: High-concurrency urban dispatch system coordinating 120,000+ real-time passenger journeys, driver state machines, and micro-billing transactions in Go. Client: Rideflow Mobility Corp (Singapore / Tokyo). Role: Lead Distributed Systems Architect. Timeline: Q2 2025 - Q1 2026 - 11 Months. Status: ACTIVE INFRASTRUCTURE - 99.999% SLA. Live URL: <https://railway.com> [Needs Verification].

Metrics: 120k+ Concurrent Trips (Real-time state sync across drivers and riders) | 38ms Allocation Latency (Median matching time within geographic geofences) | 99.999% Uptime SLA (Zero outage during peak holiday commute surges) | 14.2M Daily Events (Ingested location telemetry packets processed).

Challenge: During peak commute spikes, legacy monolithic API gateways experienced socket connection exhaustion and state race conditions. Drivers were double-booked, trip cancellations spiked by 28%, and ledger reconciliations required hours of batch correction after system outages.

Solution: Engineered an event-driven distributed state machine using Go actors and Redis cluster sharding. Geo-spatial matching was decentralized using dynamic H3 hexagonal indexing and PostGIS spatial clustering, ensuring lock-free transaction guarantees and sub-50ms driver dispatching.

Outcome: Successfully handled over 45M completed rides with zero double-allocations. Cut cloud infrastructure compute costs by 48% through optimized Go memory pooling and connection multiplexing. Stack: Go (Golang) - Redis Cluster - PostgreSQL / PostGIS - gRPC - WebSockets - Docker - Kubernetes.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Case C - NeuroLens AI Intelligence Engine (drawer: CASE 02 // ENTERPRISE INTELLIGENCE)

Subtitle: Autonomous multi-modal intelligence pipeline parsing high-volume regulatory filings with private Qdrant vector retrieval and automated telemetry. Client: NeuroLens Enterprise Systems (Zurich / London). Role: Principal AI Systems Architect. Timeline: Q3 2025 - Present - Production v2.4. Status: SOC2 COMPLIANT - PRIVATE ON-PREM VPC. Live URL: <https://raycast.com> [Needs Verification].

Metrics: 100% Deterministic Citation (Every generated conclusion linked to verified source paragraphs) | 82% Time Reduction (Average compliance audit turnaround cut from days to hours) | 0 Data Egress (Fully contained within customer on-premise VPC perimeter) | 450k Tokens / Sec (Batch document parsing through vLLM clustered nodes).

Challenge: Global compliance officers were burdened with reviewing 15,000+ pages of legal and financial directives per quarter. Generic third-party LLMs hallucinated regulatory references, suffered from context window truncation, and violated strict data sovereignty standards.

Solution: Constructed an on-premise, air-gapped retrieval pipeline fusing dense vector embeddings with sparse BM25 keyword indexes. Implemented multi-agent validation loops with LangGraph and fine-tuned open weights models that cross-reference every output against primary source text.

Outcome: Deployed across 14 sovereign financial institutions and tier-1 legal firms. Reduced audit preparation cycles by 82% and achieved 100% adherence to FINRA and GDPR regulatory requirements. **Stack:** Python - FastAPI - Qdrant Vector DB - LangGraph - vLLM - PyTorch - Docker - OpenSearch.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Case D - Apex Metrics Financial Engine (drawer: CASE 03 // FINANCIAL INFRASTRUCTURE)

Subtitle: Columnar time-series analytics engine in ClickHouse processing 100M+ daily market ticks, risk thresholds, and liquidity metrics with sub-50ms responses. **Client:** Apex Capital & Quantitative Partners (New York). **Role:** Staff Infrastructure & Data Systems Architect. **Timeline:** Q4 2024 - Q4 2025 - 12 Months. **Status:** LOW LATENCY - TICK-BY-TICK STREAMING. **Live URL:** <https://dub.co> [Needs Verification].

Metrics: 100M+ Daily Market Ticks (Sustained ingest rate during market open spikes) | 42ms Median Query Speed (99th percentile responses across multi-year tick data) | 10x Compute Cost Savings (Optimized compression vs legacy Snowflake/Redshift) | 0.001% Packet Drop Rate (Zero-loss Kafka streaming pipelines under market stress).

Challenge: Quantitative analysts and risk officers were paralyzed by legacy database queries timing out during market volatility spikes. Running a multi-asset VaR (Value at Risk) simulation took up to 45 minutes, rendering intraday hedging impossible.

Solution: Architected an ultra-fast columnar storage layer utilizing ClickHouse and Apache Kafka. Real-time ticker feeds are vectorized, compressed, and written to memory-mapped columnar chunks with continuous materialized rollups, powering live browser dashboards via WebSockets.

Outcome: Reduced portfolio risk calculation latency from 45 minutes to 42 milliseconds. Empowered hedge fund trading desks to manage \$4.2B in assets with millisecond risk visibility. **Stack:** ClickHouse - Apache Kafka - Rust - Node.js - TypeScript - Next.js - Tailwind CSS - Docker.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

Case E - Veloce Hypercar 3D Configurator (drawer only: CASE 04 // 3D SPATIAL ARCHITECTURE)

Note: NOT shown in the visible work grid; only reachable inside the case drawer (Prev/Next switcher). **Subtitle:** Real-time 3D vehicle configurator engineered in Three.js WebGL with ray-traced material fidelity, physics simulations, and 60fps mobile execution. **Client:** Veloce Automobili (Modena, Italy). **Role:** Creative Technologist & 3D WebGL Director. **Timeline:** Q1 2026 - 5 Months R&D. **Status:** PRODUCTION - AWWWARDS SITE OF THE DAY. **Live URL:** <https://framer.com> [Needs Verification].

Metrics: 6.2 MB Initial Asset Payload (Complete 3D hypercar interior and exterior geometry) | 1.4s Mobile Interactive (First touchable 3D render on cellular 4G/5G) | 310% Engagement Increase (Average time on site exceeded 4 minutes 20 seconds) | 60 FPS Fluid Refresh (Maintained across iPhone, Android, and Desktop).

Challenge: High-fidelity CAD automotive models typically exceed 180MB, resulting in 30-second mobile load times, massive bounce rates, and inability to run on mid-tier mobile GPUs.

Solution: Engineered a proprietary geometry optimization pipeline using Draco compression and custom PBR (Physically Based Rendering) shaders. Developed dynamic texture streaming and progressive LOD (Level of Detail) meshing to achieve console-grade fidelity at 6.2MB.

Outcome: Generated 2.4M unique configurator sessions in the first 30 days. Directly supported the sell-out of the limited-edition 150-unit production run within 48 hours of launch. Stack: Three.js - WebGL 2.0 - GLSL - Blender - Draco Compression - Web Audio API - Vanilla JS.

5. Facts, Numbers & Claims (client must verify each)

- Scale claims: platforms that scale to millions | Scaling to millions of users | tens of thousands of concurrent client actions | 100K+ RPS throughput (backend hover) | 100M+ daily events (data hover).
- Aura OS: 74% CPU reduction | locked 60fps at 25,000 active nodes | <8ms motion-to-photon | 4.8x memory efficiency | 5,000-vector DOM breakdown threshold | below 18fps legacy | 420,000+ daily active designers (also 420K) | 99.99% session stability | 62% less battery drain | fewer than 16 GPU draw calls.
- Rideflow: 120,000+ real-time journeys | 38ms allocation latency | sub-50ms dispatch | 99.999% uptime SLA | 14.2M daily events | 45M completed rides | zero double-allocations | 48% infra cost cut | 28% legacy cancellation spike (before fix).
- NeuroLens: 100% deterministic citation | 82% time reduction (days to hours) | 0 data egress | 450k tokens/sec | 15,000+ pages/quarter | 14 institutions | 100% FINRA/GDPR adherence.
- Apex: 100M+ daily ticks | sub-50ms responses | 42ms median query | 10x cost savings | 0.001% packet drop | 45-min VaR to 42ms | \$4.2B assets | 91% footprint reduction.
- Veloce: 60fps mobile | 6.2MB payload (vs 180MB CAD) | 1.4s interactive | 310% engagement | 4min 20s avg time | 2.4M sessions / 30 days | 150-unit sell-out in 48h | 92% polygon cut | 30s legacy load.
- Process/timelines: 10-to-12-week MVP (also 10-12 weeks to market) | automation 6-8 wks | launch 9-11 wks | modernization 8-10 wks | flagship 6-8 wks | Aura 8 months Q1-Q3 2026 | Rideflow 11 months Q2 2025-Q1 2026 | NeuroLens Q3 2025-Present v2.4 | Apex 12 months Q4 2024-Q4 2025 | Veloce 5 months Q1 2026 | review within 24h / 24 business hours.
- Compliance/certification claims: SOC2 Hardening | SOC2 Type II | PCI-DSS | HIPAA, FHIR, GDPR | SAML/SSO | RBAC | SOC2 compliant telemetry | FINRA | zero-data-retention | on-prem VPC / air-gapped | 99.99% production SLA | 99+ Lighthouse | Sub-100ms LCP/FCP | 4K 60FPS.
- Company claims: not a bloated 500-person agency | every member senior with proven production credentials | 100% IP transfer (code, Figma, schemas, credentials) | no vendor lock-in | direct engineer contact | AWWWARDS Site of the Day (Veloce) | 2025/2026 dates | 500-person denial.
- Money: NO fixed pricing on site. Only wizard budget bands: \$15,000-\$25,000 | \$25,000-\$50,000 | \$50,000-\$100,000 | \$100,000+. No guarantees with amounts found.

6. Testimonials & Reviews

RESULT: None found. No testimonial section, no client quotes, no person names, no company/role attributions, and no star ratings exist in index.html or the case-drawer data. Case outcomes name client organizations (e.g. Aura Spatial Systems) but contain no quoted endorsement. If testimonials are required, they are MISSING and must be supplied by the client (do not invent).

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

7. FAQ

RESULT: None found. No FAQ section, no questions, and no answers exist anywhere in the scanned files. If FAQs are required, content is MISSING and must be supplied.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

8. Contact & Business Information

- Business name (as shown): CODDEN (header/drawer) | CODDEN ATELIER (footer: (c) 2026 CODDEN ATELIER. ALL RIGHTS RESERVED.) | Title tag: CODDEN - Independent Technology & Digital Creative Atelier.
- Email: hello@codden.tech (drawer + finale + mailto links). Claim: Direct architect review within 24h; senior engineering director review within 24 business hours.
- Phone: NOT FOUND. Address/location: NOT FOUND (only client cities mentioned: San Francisco CA; Singapore/Tokyo; Zurich/London; New York; Modena Italy - these are case-client locations, not Codden's).
- Hours: NOT FOUND (only response-time promises above). Contact form: 6-step wizard (name/email/company + project synopsis); no phone field, no address field.
- Social (footer, generic hrefs - Needs Verification): GitHub <https://github.com> | LinkedIn <https://linkedin.com> | X/Twitter <https://x.com> | Dribbble <https://dribbble.com>. These look like placeholder links, not real profiles.

Verification Status: ☐ Correct ☐ Needs Correction ☐ Missing / Should Be Added ☐ Needs Verification

9. Visuals & Image-Based Text

- assets/card1.jpg - alt: Aura OS Spatial Workspace Interface / Aura OS Spatial Interface. Abstract 3D render. HUD overlay text: FR // 01, MOTION, TACTILE 3D, 4K - 60FPS. Communicates: flagship spatial-canvas product visual.
- assets/card2.jpg - alt: Apex Metrics Financial Analytics. HUD: FR // 02, MOTION, PARAMETRIC, 4K - 60FPS. Communicates: financial analytics visual.
- assets/card3.jpg - alt: Framer Showcase Web Projects (deck) - NOTE: alt text says Framer, but drawer maps card3 to Veloce Hypercar 3D Configurator - inconsistent, Needs Verification. HUD: FR // 03, MOTION, BRUTAL SPACE, 4K - 60FPS.
- assets/card4.jpg - alt: Rideflow Platform Architecture / Rideflow Mobility Platform. HUD: FR // 04, MOTION, MECHANICAL, 4K - 60FPS. Communicates: mobility platform visual.
- assets/card_raycast.jpg - alt: NeuroLens AI Enterprise Engine. Used for NeuroLens case. Filename references Raycast and drawer live URL is raycast.com - Needs Verification (possible placeholder mix-up).
- SVG topology map: text labels CODDEN, FRONTEND, BACKEND, MOBILE, AI & ML, DATA, CLOUD with dashed connectors. No photographic claims. Decorative grid + status dot + REC dots are non-text visuals.

- No badges with certifier logos, no screenshots with embedded paragraphs, no diagrams with extra statistics beyond text already captured. No pricing tables or guarantee seals found.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

10. Content Items Requiring Verification (flagged)

- 1. ALL case studies (clients, cities, roles, timelines, metrics, outcomes) - no evidence on-page they are real; PRD itself warns against fake proof. Mark Needs Verification.
- 2. All performance numbers (74%, 60fps/25k nodes, 120k trips, 100M ticks, 42ms, \$4.2B, 2.4M sessions, 150 units/48h, AWWWARDS award, 420K designers, 45M rides, 14 institutions).
- 3. Compliance claims (SOC2 Type II, PCI-DSS, HIPAA/FHIR/GDPR, FINRA, 99.999%/99.99% SLAs, penetration audits) - confirm certifications actually held.
- 4. Live URLs: superlist.com, railway.com, raycast.com, dub.co, framer.com - appear to be third-party products, likely placeholders. Confirm or replace.
- 5. Social hrefs (github.com, linkedin.com, x.com, dribbble.com root domains) - replace with real profiles or remove.
- 6. card3.jpg alt says Framer but case says Veloce; card_raycast.jpg filename vs Raycast URL - fix alt/filename/URL consistency.
- 7. Veloce case hidden from work grid (only in drawer) - confirm intentional or add grid card.
- 8. Missing: phone, address, hours, testimonials, FAQs, pricing, team names, locations served - confirm whether to add or deliberately omit.
- 9. Date sensitivity: 2025/2026 timelines, (c) 2026, essay 'in 2026' - confirm current.
- 10. Email hello@codden.tech - confirm mailbox exists; confirm 24h review promise is operationally true.
- 11. Wizard copy: budget bands, timeline bands, receipt #CDN-000000, validation alert text - confirm commercial accuracy.
- 12. Manifesto/About claims (500-person denial, every member senior, 100% IP transfer, no lock-in) - confirm legal/HR accuracy.

Verification Status: [] Correct [] Needs Correction [] Missing / Should Be Added [] Needs Verification

11. Final Client Verification Checklist

- Company/business name (CODDEN vs CODDEN ATELIER vs title-tag wording).
- Main messaging (WE BUILD DIGITAL; hero lead; manifesto; process promise).
- Services/products (7 capabilities + tags; 4 finder blueprints; 6 industry domains).
- Service descriptions (exact tag lists; finder paragraphs; domain spec rows).
- Features and benefits (deliverables per phase; maturity-level includes; innovation cards; tech stacks).
- Pricing (wizard bands \$15k-\$25k / \$25k-\$50k / \$50k-\$100k / \$100k+ - confirm; no public fixed prices).
- Statistics and numbers (full Sec. 5 table - verify every figure).
- Locations (no Codden address on site - add or confirm omit; client cities are not Codden locations).
- Contact information (hello@codden.tech; 24h promises; missing phone/address/hours).
- Testimonials (none on site - supply or confirm omit).

- Certifications (SOC2/PCI/HIPAA/GDPR/FINRA claims - evidence required).
 - Guarantees (zero-downtime, 100% IP, SLAs, 24h review - confirm wording/legal).
 - FAQs (none on site - supply or confirm omit).
 - Claims/promises (scale, senior-only team, no lock-in, award, sell-outs, cost cuts).
 - Image-based text (HUD labels, SVG node labels, alt texts, filename/URL mismatches).
 - Other: live URLs, social links, hidden Veloce case, 2025/2026 dates, receipt/validation copy.
-

Report generated 2026-09-30 from workspace files index.html and js/codden.js. Content-only audit; design, UI quality, colors, spacing, animations, responsiveness, and aesthetics were explicitly out of scope. Exact wording preserved; [ok]/->/- transliterations noted. Do not invent missing information.
